Sparex Induction Heat Tool

Replacement
coils are
also available!

S. 163541

Committed to improving agricultural operations in every aspect, Sparex have introduced an advanced Induction Heat Tool to loosen stubborn and seized bolt fixings. This 230V handheld device comes in a practical and robust case complete with direct and flexi coils in various sizes to accommodate different bolt dimensions (refill coils available separately). The induction element delivers high heat fast which the coil directs only to the required area, resulting in no damage to the surrounding machine or surface. The Sparex Induction Heat Tool is ideal for hard to reach areas and applications that aren't suitable for gas heat.

So what makes the Sparex Induction Heat Tool better than the rest?

Safer than alternatives

Without the need for gas and a naked flame, the dangers for the user are significantly minimised.

Convenient

The Induction Heat Tool kit is supplied in a lockable plastic case providing useful storage and easy transportation.

Controlled accuracy

Induction coils produce high frequency magnetic fields and are ideal for accessing hard to reach areas (such as axle bolt placements) and ensure that heat is localized only to the part in need and not the surrounding area.

Efficient

The coil can reach high temperatures quickly with a power of up to 1000W. Within seconds the heat expands the corroded nut and breaks down corrosive bonds, saving time and increasing repair efficiency.

Established in 1965, Sparex have earned the reputation as the first choice for agricultural parts and accessories and can always be relied on for high quality, functional parts. Sparex have a strong global presence with subsidiaries in 19 markets and trade customers from over 100 countries.
